ECSR, Collegio Carlo Alberto and NASP
Joint Spring School on

Work, Employment and Inequality

March the 19th - the 23rd, 2018
Collegio Carlo Alberto
Piazza Vincenzo Arbarello, 8 – Turin (Italy)

The topic for the sixth edition of the ECSR Spring School is “Work, Employment and Inequality”. The School is promoted by the European Consortium of Sociological Research (ECSR), Collegio Carlo Alberto and by the universities of Milan and Turin in the frame of the NASP, Network for the Advancement of Social and Political Studies. It provides high-quality training on leading-edge theories and methods concerning the changing structure of work, occupations and employment. The focus of the School is on how changes in the occupational structure, the labour market and employment relationships affect the life chances of different socioeconomic groups such as youths, women, the working class or migrants.

The School is organized by Gabriele Ballarino (University of Milan), Daniel Oesch (University of Lausanne), Filippo Barbera, Tiziana Nazio and Manuela Naldini (Collegio Carlo Alberto and University of Turin).

Lectures will be given and presentations discussed by Gabriele Ballarino, Paolo Barbieri (University of Trento), Thijs Bol (University of Amsterdam), Stefano Cantalini (University of Milan), Giorgio Cutuli (University of Trento), Jerry Jacobs (University of Pennsylvania), Daniel Oesch, Jacqueline O’Reilly (University of Brighton), Nazareno Panichella (University of Milan), Helen Russell (ESRI, Dublin), Cristina Solera (Collegio Carlo Alberto and University of Turin), Heike Solga (WZB, Berlin).

1. Keynote lectures

Heike Solga: New opportunities or reinforced disadvantages? Variation in returns to low-achieving school leavers’ participation in pre-vocational training measures

School leavers with low educational attainment face great difficulties in their school-to-work transitions. They are, however, quite heterogeneous in terms of their personal and social resources. These within-group differences may influence who shows initiative during the school-to-work transition period and thereby helps employers recognize their learning potential at labor market entry. Yet this recognition also depends on the ways employers select applicants, which may prevent them from discovering such within-group differences. In the lecture, I therefore investigate the interplay between agency and its constraints, that is, whether higher cognitive and noncognitive skills and more parental resources provide low-achieving school leavers with new opportunities in the school-to-work transition period or whether their low school attainment causes the persistency of their disadvantages. I will pay particular attention to pre-vocational measures and assess whether and for whom these measures generate new opportunities or reinforce disadvantages. I use panel data from the German National Educational Panel Study (NEPS), which started in grade nine. The NEPS also includes school leavers from special-needs schools.

Jerry Jacobs: Occupations and Inequality: Past, Present and Future

In this paper, I argue for the importance of occupations as a unit of analysis for sociologists. I show that it is useful to study individual occupations – as distinct for social strata or social classes—for the study of inter-generational inequality. This portion of the paper draws on data on the career plans of several million college freshmen in the US. In the second portion of the paper, I use occupational data to examine a central issue in the debate about the future of work. Specifically, I examine whether the rate of occupational change is getting faster or slower. The “jobless future” hypothesis depends on
the idea that technological is accelerating rapidly, so much so that jobs will disappear faster than they
am be replaced. Empirically, drawing on US census data from the period 1870-2015, the evidence I
present indicates that the rate of occupational change is slower since 1970 than it was in earlier periods
of time. Finally, I suggest that occupational analysis can connect our understanding of social
stratification with the sociology of work, the sociology of professions and some these in
organizational sociology.

Jacqueline O’Reilly: Are some employers more ‘youth friendly’ than others? Employment
regimes, sectors and gender disparities in the Great Recession
Despite national differences in youth employment, many countries share striking similarities in the
uneven sectorial distribution of job opportunities for young women and men. We ask which
employers are more ‘youth friendly’, whether this differs between counties, and how has this changed
during the Great Recession in Europe? Using a shift-share analysis we find job opportunities in ‘youth
friendly’ sectors have been lost either because the sector has shrunk, or because employers have a
lower propensity to hire youth on full-time permanent contracts. Where jobs for youth have increased
has been in part-time and temporary work. Youth vulnerability to unemployment during the Great
Recession is not only contingent on cross national differences in employers’ engagement with
institutions shaping school-to-work transitions; gender segregation and the fact some sectors have
been particularly fragile during the crisis also plays a significant part.

Thijs Bol: Occupations and Wage Inequality

Sociologists have long argued that occupations are the central unit of stratification in labor markets and “the backbone” of the social inequality system, but little research has focused on identifying why some occupations pay more than others. On the one hand, economists argue that wage differentials between occupations are fully explained by the complexity of tasks that workers perform. Sociologists, on the other hand, see occupations as more than a bundle of job tasks and focus on occupational institutions in explaining why some occupations pay more than others. Recent research for example emphasizes that occupational closure (licensure, educational credentialing) partly explains differences in mean occupational wages. Using empirical results from several countries, I will show (1) why it is important to take occupations into account if we want to understand wage inequality, and (2) how sociological theories can contribute to understanding occupational wage inequality.

**Helen Russell: Recession, unemployment and subjective well-being**

This lecture considers how the recession influenced the well-being of European citizens. It focuses on the impact of unemployment and job insecurity, which became increasingly widespread during the crisis. Drawing on theories of work quality and work values it outlines the mechanisms, both financial and non-financial, that are expected to link unemployment and subjective well-being and examines how the effect varies across social groups for example by gender and age. The lecture also considers the societal context in which unemployment occurs. It investigates the question “does unemployment hurts less when there is more of it around?” Do high levels of unemployment mean that the experience is normalised and is less stigmatising, or does high unemployment deplete network resources. Finally, we examine the evidence of institutional effects: Do welfare state and ‘flexicurity’ policies moderate the impact of recession on subjective well-being?

**Daniel Oesch: Job polarization and middle class erosion in Europe?**

Over most of the 20th century, the condition of the working class held centre stage in the social sciences. Today, the focus has shifted to the “condition of the middle class” as a consequence of two developments. Evidence on income distribution indicates that economic growth since the 1980s has
mainly benefitted top income earners. Moreover, recent research suggests that technology polarises the job structure by making mid-range clerical and industrial workers redundant. The combination of a growing moneyed elite at the top and the hollowing-out of the middle has struck a nerve with the wider public, convinced of the phenomenon of “middle class squeeze”. Our lecture argues that this debate is fundamentally flawed. What we observe in Western Europe is not the demise of the middle class, but the decline of the working class. We provide conceptual arguments to make sense of the debate on middle class erosion – and show empirical evidence of how the employment structure evolved in Europe over the last decades. Thereby, we will try to clarify several methodological issues related to the analysis of labour market data and occupational change.

Key references

**Paolo Barbieri: Flexible Employment in Europe. Assessing social stratification through the lens of labour market segmentation: a sociological insight**

In a nutshell, the lesson will deal with Search Theory as the theoretical foundation of the “Equality-Employment trade-off” much vaunted by the nineties Oecd and the mainstream economics. We will see how labour market deregulation in Europe took place as “deregulation at the margins” either on an age or on a skill basis, thus dualizing labour markets and creating new forms of inequalities. By means of empirical research papers, we will understand how such dualization has deeply affected some (weaker) contexts, namely S.E., and what social consequences came with it.

**Cristina Solera: Women’s participation into paid work and men’s participation into unpaid work: the link in a comparative perspective**

During the twentieth century, women became increasingly engaged in labour market activities also when they got married and had children. Also men increased their engagement in unpaid work activities, but the increase was much smaller, started from a very low level, and was mainly confined to high educated couples, so that scholars speak of a ‘stalled gender revolution’. A large body of research shows that the pivotal event of ‘stalling’ gender equality is the birth of the first child. Yet, how much and for whom vary considerably across countries with different economic, institutional and cultural settings. Contexts indeed shape the degree and type of inequalities not only between but also within men and women. In particular, there is evidence that education polarises behaviours to a greater extent where a general cultural shift in favour of non-traditional gender roles has not occurred, and where care and reconciliation policies are scarce, not universal, and mainly addressed to mothers. In this lecture I shall review the theoretical and empirical literature on the gender division of labour and its implication for inequalities (and not only gender inequalities). First, I shall summarise the
debate on its micro and macro-level explanations. Then, by mainly drawing from cross-country comparative data, I shall show how such division has changed over time, how it differs by education or class, how changes and differences vary across countries, being linked to different welfare and gender regimes.

2. Workshops

**Jerry Jacobs - Thijs Bol: How to get your papers published**

Jacobs: In this session we will discuss various stages of the publication process. These include: clarifying the objectives and contribution of the paper; getting feedback before submitting to a journal; selecting an appropriate journal; reacting to rejection letter; responding to reviews in the “revise and resubmit” stage.

Bol: There is no magic formula that guarantees that a paper will be accepted by a journal. A substantial part of getting a paper published depends on luck. Having said that, there are some pointers that you can follow in preparing a manuscript for publication. In this session I will talk about my experiences in publishing papers and give some suggestions that might help getting your papers out there.
Giorgio Cutuli: Longitudinal approaches for inequality studies

The use of longitudinal data and the implementation of panel data approaches to inequality studies comes with relevant theoretical and technical advantages, allowing for a deeper understanding of dynamics of socio-economic risks and relaxing common assumption of cross sectional perspective. Panel models permits a more fine-grained definition of accumulation mechanisms and a more adequate test for the evaluation of the influence of micro-level events and of role played by macro level factors. The seminar illustrates the advantages of: a) tacking research questions on social stratification dynamics adopting a longitudinal perspective; b) applying panel data approaches on available micro-level data in order to disentangle the role played by distinct mechanisms in the accumulation of socio-economic disadvantages; c) handing repeated cross-sectional and pseudo-panel data in order to deal, at least partly, with the scarcity of comparative micro level panel data.
