Syllabus

Portfolio Choice and Asset Pricing—MAFIRM Collegio Carlo Alberto

Prof. Matthijs Breugem

Setup

- Teaching style: Introduction of new theory is alternated with in-class exercises to facilitate immediate understanding of the concept.

- Students should bring a laptop with Excel, Python, Matlab or comparable software.

Grading

- Homework set: 8 points

  - To be submitted in groups of 2-3 students

- Final Exam: 25 points

  - Individual, closed book
  - One A4 handwritten "cheat sheet" allowed
  - Duration: 2 hours

Prerequisite Knowledge and Skills

- Basic Linear Algebra and Calculus

  - Elementary matrix and vector operations
  - Constrainted optimization (Lagrangian)
  - Solving system of equations
  - Recommended Book: Simon and Blume 1994: Mathematics for Economists (Strictly Required: Chapters 1-8, 17-18, 30.2)

- Statistics and Probability

- Expected value, Variance and Covariance
- Multivariate Gaussian Distribution
- Recommended Book: Dekking et al 2005: A Modern Introduction to Probability and Statistics, Understanding Why and How (Strictly Required: Chapters 1-10, 19-22)

- Basic knowledge of Excel, Python, Matlab, or other related program

Content

- **Chapter 1**: Arbitrage-free markets and pricing by replication

  - Basic model of financial markets
  - Futures and options
  - Complete and incomplete markets
  - Law of one price and pricing by replication
  - Exploiting arbitrage opportunities
  - First fundamental theorem of asset pricing
  - Second fundamental theorem of asset pricing
  - Pricing kernel and risk-neutral pricing
  - Pricing on a binomial tree
  - Examples: pricing American options and convertible bonds
  - Case study 1: valuation of an executive stock options package

- **Chapter 2**: Modern portfolio theory

  - Lotteries and risk-aversion
  - Mean-variance preferences
  - Mean-variance portfolio optimization with a single and multiple risky assets
  - Mean-variance portfolio optimization without riskless asset
  - Minimum variance portfolio, capital allocation line, efficient frontier
  - CAPM (derivation and interpretation)
  - Empirical test of CAPM
  - Case study 2: CAPM and the cost of capital
  - Pricing kernel consistent with mean-variance optimization
  - Roll's Critique

- **Chapter 3**: Consumption-based Asset Pricing

  - Utility theory and (Arrow-Pratt) risk aversion

- – Static portfolio optimization in complete and incomplete markets

- – Dynamic portfolio optimization in complete and incomplete markets

- – Dynamic Asset Pricing in complete and incomplete markets

- – Consumption CAPM

- – Equity Premium Puzzle

- **Chapter 4**: Multi-Factor Models

  - – Parameters to estimate a factor models

  - – Macro, fundamental and statistical factors

  - – Fama-French 3-Factor model

  - – Interpretation of factor models

  - – Smart beta

  - – Event Studies

  - – 1-Factor CAPM data mining exercise
